

Create our final model

```
[98]: final_model = Pipeline([
      ("preprocessor", preprocessor),
      ("classifier", LogisticRegression(
        max_iter=1000
      ))
    ])
```

```
[99]: #Train it on the training data:
```

```
[100]: final_model.fit(X_train, y_train)
```

Save the model

```
[102]: import joblib

      joblib.dump(final_model, "telco_churn_model.pkl")
```

```
[102]: ['telco_churn_model.pkl']
```
